

# ITR1 Planning Document

## User Stories:

1. User needs to visualise and organise tasks in one place. This story was implemented as a feature by creating a to-do list app where users can input their tasks to see on a list and check them off when they are completed.
2. User forgets to complete a task due to having many due dates making it hard to keep track of all of them. This was implemented by adding a feature that allows users to add due dates next to the task they want to add to visually see everything that needs to be done and when it needs to be done.
3. Users need to manage their studying and work sessions more effectively. This was implemented as a pomodoro timer feature. This feature allows users to have a timer alongside the to-do list that allows them to take consistent breaks in between studying allowing for better work management.
4. Users have a hard time managing tasks, wasting too much time deciding on what to do next after completing a task. To fix this we implemented a feature that allows users to add a ranking beside their tasks when they make them so they can immediately get to them after completing the current task.
5. Users have difficulties prioritising tasks due to having many important tasks and less important tasks. This was implemented as a feature that allows users to choose a general priority label either high, medium or low which helps them decide the importance alongside the numbering system in user story 4.
6. User authentication: users need to make an account so that they can securely access the application so we created a login page for users to access all their tasks individually and securely.
