

Log Report - Group 6

Meeting Time: 30 mins each 3 days per week. Also, we made a discord server to discuss about our idea more freely when we are on our own time. In additionally, it helped for the group members who missed the meetings to indicate what we have discussed during the meeting. This server puts everyone in group on the same track, and make sure each group member knows what our objective of this project is and what to do individually.

We discussed how to split up the implementation among the group members. During the meeting each member presented their idea about how are they going to implement the features. We have some concerns regarding testing as the files can be opened by some members IDE while it does not work for other for example if one member can run the project through eclipse, but the other member cannot. So, to overcome this problem, we decided to make sub project that only contains individual's feature and test our features through that project. Also, some group members had problem with OS. When running program in Window, everything works fine, but running in MAC does not work well.

As we thought more about the user story, it became clear what features what we needed to add. As the project progressed, we added more features that will be a necessary for other user story.

To make sure we implement the features properly, we made sure to read up on documentations of Java libraries, for example JavaFX. We gave each other a considerable amount of time to learn the documentation so we would all allocate a similar time to completing each feature for iteration 1. The actual time taken to complete the features stayed close to our initial goal of around a week but there were some hiccups due to testing issues.
